Mail Stop Appeal Brief – Patents
Commissioner for Patents
P.O. Box 1450
Alexandria VA 22313-1450

APPEAL BRIEF UNDER 37 C.F.R. §1.192

Sir:

The Applicant hereby submits this Brief in support of its appeal from a final decision of the Examiner in the above-captioned case.

10/08/2004 LHONDIM1 00000018 09737140

01 FC:1402

340.00 DP

(1) REAL PARTY IN INTEREST

Intel Corporation of Santa Clara, CA.

(2) RELATED APPEALS AND INTERFERENCES

No related applications.

(3) STATUS OF CLAIMS

In this application, Claims 1 - 27 are pending.

Appl. No. 09/737,140
Appeal Brief filed 10/04/2004

Examiner rejected claims 1, 2, 5, 6, 10, 11, 14, 15, 19, 20, 23, and 24 under 35 U.S.C. § 103(a) as being unpatentable over U.S. Patent 5,732,282 (hereinafter "Provino") in view of Admitted Prior Art (APA.)

Applicant appeals the Examiner's decision on Claims 1, 2, 5, 6, 10, 11, 14, 15, 19, 20, 23, and 24 with respect to the rejection under Sections 103.

(4) STATUS OF AMENDMENTS

A final office action was mailed May 4, 2004 rejecting claims 1, 2, 5, 6, 10, 11, 14, 15, 19, 20, 23, and 24 for the reasons specified above. A response after final was filed August 4, 2004.

The claims found in the Appendix of this Appeal Brief reflect the claims as they are understood by the Applicant to stand at the date of this appeal.

(5) SUMMARY OF INVENTION

According to one aspect of the invention, a method includes a processor executing a BIOS routine receiving information from at least one first computing system units; the processor storing the received information in a memory; and for each second computing system units, the processor receiving an initial request for the received information from the second computing system unit, in response to the request the processor providing to the second computing system units at least one of the received information stored in the memory before a receipt of the request, and the processor providing to the second computing system unit at least one of the received information received subsequent to the request. (See **Figure 2.**)

6) ISSUES

In the Final Office Action mailed May 4, 2004, the Examiner has:

- (1) continued a rejection of claims 1, 2, 5, 6, 10, 11, 14, 15, 19, 20, 23, and 24 under 35 U.S.C. § 103(a) as being unpatentable over U.S. Provino in view of APA.

The question presented on this Appeal is:

- (1) Whether the statements made by applicant in the "background" section of the pending application are in fact admissions of prior art?

(7) GROUPING OF CLAIMS

Claims 1 - 27 are grouped together.

(8) ARGUMENT

Question 1 -- Whether Statements Made By Applicant In The Application Are To Be Considered Prior Art?

PROBLEMS INVOLVED IN THE PRIOR ART SHOULD BE INDICATED AND ARE NOT TO BE CONSIDERED ADMISSIONS OF PRIOR ART (MPEP, section 608.01(c)).

As stated above the examiner rejected claims independent claim 1, 10, and 19 under 35 U.S.C. § 103(a) as being unpatentable over Provino in view of applicant's alleged APA.

The examiner states that applicant has made certain admissions of prior art in the background section of applicant's application. In particular, the examiner states applicant has made the admission that component and system information obtained by a first device is shared with another device, and is therefore an admission of prior art. In support of the examiner's position, the examiner makes reference to the following statement in applicant's background:

During a computer system BIOS routine initialization, each device sequentially initializes under the control of the executing BIOS routine. However, at least one device that has already initialized may acquire component and system information that is useful to and should be provided to at least one other device. Examples of such information is a device that has tried to read from a memory (e.g., a disk) and encountered an error, and a device that is coupled to a channel that is presumed to be losing data. This information includes error information, status information, configuration information, and event information pertaining to devices and systems. The acquired information should be able to be made available to other devices. These other devices can include information logging devices and devices whose execution and/or state may be dependent upon the information. (emphasis added.) (Applicant's application, pg. 3, lines 9-19.)

Applicant respectfully disagrees with the examiner. Certain statements included in the background are identifications of problems in the prior art and/or problems that are solved by applicant's invention. The statements are clearly not an admission of prior art.

Simply because the statements have been provided in the background section of the application does not make the statements admissions of prior art. Rather, as stated in the MPEP, in the Background section, "where applicable, the

problems involved in the prior art or other information disclosed which are solved by the applicant's invention should be indicated." (MPEP, section 608.01(c)).

In the case at hand, consider the following statement from above:

During a computer system BIOS routine initialization, each device sequentially initializes under the control of the executing BIOS routine. However, at least one device that has already initialized may acquire component and system information that is useful to and should be provided to at least one other device. . . .

The acquired information should be able to be made available to other devices.

(emphasis added.) (Applicant's application, pg. 3, lines 9-17.)

Clearly applicant is identifying a shortcoming in the prior art by stating that component and system information obtained by a device **should be shared with at least one other device.** Applicant is clearly stating component and system information obtained by a device not currently shared, but there is a need to share the information with other devices.

Therefore, applicant respectfully submits that applicant's statement that component and system information obtained by one device and should be shared and made available to other devices, is not an admission of prior art.

Furthermore, considering Provino does not disclose all of applicant's claimed limitations, applicant's claims are patentable over Provino.

CONCLUSION

For all of the foregoing reasons, this Board is respectfully requested to remand this application to the Examiner for reconsideration consistent with an order that the Examiner pass this case to issuance unless a proper rejection to the claims can be made.

FEE FOR FILING A BRIEF IN SUPPORT OF APPEAL

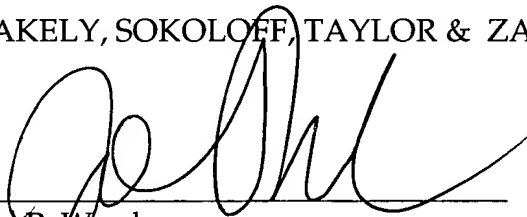

Enclosed is a check in the amount of \$340.00 to cover the fee for filing of a brief in support of an appeal required under 37 C.F.R. 1.17(f) and 1.192.

CHARGE OUR DEPOSIT ACCOUNT

Please charge any shortage to our Deposit Account No. 02-2666.

Respectfully submitted,

BLAKELY, SOKOLOFF, TAYLOR & ZAFMAN LLP

Appendix A

1. (Previously Presented) A method comprising:
 - a processor executing a BIOS routine by receiving information from at least one first computing system units, the information comprises at least one of error information, status information, and configuration information;
 - the processor executing the BIOS routine by storing said received information in a memory;
 - for each of at least one second computing system units,
 - the processor executing the BIOS routine by receiving an initial request for said received information from the second computing system unit;
 - the processor executing the BIOS routine by providing to the second computing system unit in response to said received request at least one of said received information stored in said memory before the receipt of said request if any is stored; and
 - the processor executing the BIOS routine by providing to the second computing system unit at least one of said received information received subsequent to said request.
2. (Original) The method defined in claim 1 wherein said information comprises at least one of unit information, system information, error information, status information, configuration information, and event information.
3. (Original) The method defined in claim 1 wherein the receiving said information from the first units is according to an API.

4. (Original) The method defined in claim 1 wherein the providing said information to the second units is according to an API.
5. (Original) The method defined in claim 1 wherein the storing the received information in a memory is according to a time of receipt of said information.
6. (Original) The method defined in claim 1 wherein the providing the received information stored in the memory before a receipt of said request is according to a time of receipt by said processor.
7. (Original) The method defined in claim 1 wherein said information received by said processor is appended to include at least one of a sequence number and an absolute time.
8. (Original) The method defined in claim 1 wherein the provided received information stored before the receipt of said request includes one of all said received information and a categorized subset of all said received information.
9. (Original) The method defined in claim 1 wherein the provided information received subsequent to said request includes one of all said received information and a categorized subset of all said received information
10. (Previously Presented) A machine-readable medium that provides instructions, which when executed by a processor, cause said processor to perform operations comprising:

during execution of a BIOS routine, receiving information from at least one first computing system units, the information comprises at least one of error information, status information, and configuration information;

during execution of the BIOS routine, storing said received information in a memory;

for each of at least one second computing system units,

during execution of the BIOS routine, receiving an initial request for said received information from the second computing system unit;

during execution of the BIOS routine in response to said request, providing to the second computing system unit at least one of said information stored in said memory before the receipt of said request if any is stored; and

during execution of the BIOS routine, providing to said second computing system unit at least one of said received information received subsequent to said request.

11. (Original) The medium defined in claim 10 wherein said information comprises at least one of unit information, system information, error information, status information, configuration information, and event information.

12. (Original) The medium defined in claim 10 wherein the receiving information is according to an API.

13. (Original) The medium defined in claim 10 wherein the providing said information stored to the second units is according to an API.

14. (Original) The medium defined in claim 10 wherein the storing the received information in a memory is according to a time of receipt of said information.
15. (Original) The medium defined in claim 10 wherein the providing the received information stored in the memory before a receipt of said request is according to a time of receipt by said processor.
16. (Original) The medium defined in claim 10 wherein the information received is appended to include at least one of a sequence number and an absolute time.
17. (Original) The medium defined in claim 10 wherein the provided information stored before the receipt of said request includes one of all said received information and a categorized subset of all said received information
18. (Original) The medium defined in claim 10 wherein the provided information received subsequent to said request includes one of all said received information and a categorized subset of all said received information
19. (Previously Presented) A computer that comprises:
a stored BIOS program in a non-volatile memory that includes instructions that cause said computer to:
 receive information from at least one first units coupled to said computer,
the information comprises at least one of error information, status information,
and configuration information;
 store said received information in a memory;

for each of at least one second units coupled to said computer,
receive an initial request for said information from the second unit;
in response to said request, provide to the second unit at least one
of said information stored in said memory before the receipt of said
request if any is stored, and
provide to the second unit at least one of said received information
to the second unit received subsequent to said request.

20. (Original) The computer defined in claim 19 where the information includes at least one of unit information, system information, error information, status information, configuration information, and event information.

21. (Original) The computer defined in claim 19 wherein the receive information from the first units is according to an API.

22 (Original) The computer defined in claim 19 wherein the provide to the second unit information is according to an API.

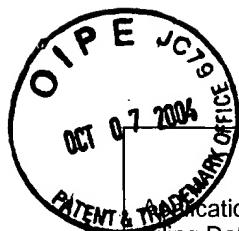

23. (Original) The computer defined in claim 19 wherein the store the received information in a memory is according to a time or receipt of said information.

24. (Original) The computer defined in claim 19 wherein the provide the received information stored in the memory before a receipt of said request is according to a time of receipt of said information.

25. (Original) The computer defined in claim 19 wherein the information received by said processor is appended to include at least one of a sequence number and an absolute time.

26. (Original) The computer defined in claim 19 wherein the provided information stored before the receipt of said request includes one of all said received information and a categorized subset of all said received information.

27. (Original) The computer defined in claim 19 wherein the provided information received subsequent to said request includes one of all said received information and a categorized subset of all said received information.
